My web application idea is to create an itinerary planner called ITINIFY, where users can plan and create itineraries for any event in their life. The homepage will welcome the user and give them a prompt to start planning right away, or the user can explore the website using the toggle feature and navigate their way to the itinerary page from there.

On the actual itinerary page, with the use of CRUD, users will be able to completely customize their itinerary. They have the option to add a new plan, edit any existing plans, and delete plans that are no longer needed or have already been completed. They will also be able to input the destination, which will be added as a header after the input. This gives users full control over their planning process in a simple and quick way.

With the utilization of Font Awesome for icons and Bootstrap for elements such as the navigation bar, footer, and table layout, I plan on designing this website to be very user friendly and easy to navigate.
